

SOUND DEVELOPMENT CHART

The chart below displays the average age that 90% of all children typically produce each consonant and consonant cluster sound correctly. A child's speech may be considered delayed if he/she has not developed the sound by the end of each given age. Intervention should be considered when speech sound production has a negative impact on academics, social interactions with peers, and/or draws negative attention to a child's speech.

(based on the Articulation and Phonology Video Assessment Tool normative studies conducted by the Lavi Institute, 2023)
